

# Computers don't make sandwiches.

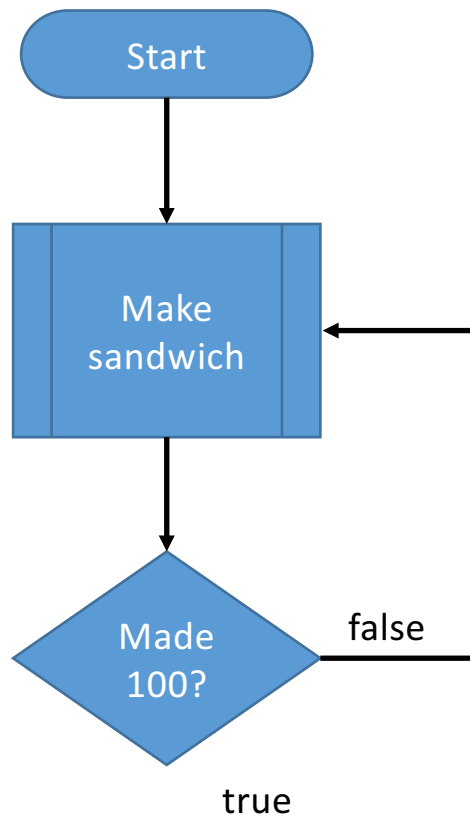

- Computers don't make sandwiches, they create data in their memory.
- Sometimes we group related data together and call it an object.

# Copying objects.

- A computer can copy an object by copying the data from one memory location to another memory location, this is fast and easy to do.
- When we are designing algorithms we may take advantage of this. Some algorithms might involve making many copies of an object and then slightly modifying the copies.

100 sandwiches.

100 objects.
